

ALA-TOO INTERNATIONAL UNIVERSITY

BUSINESS ADMINISTRATION SOFTWARE

Spring Semester 2025-2026

xxx

*The goal is to turn data into information, and
information into insight.*

– Carly Fiorina

TODAY'S STRUCTURE

TWO CONNECTED PARTS

PART 1

- Choosing KPIs for different roles
- Setting thresholds and linked actions
- Preventing “multiple truths” through KPI definition tables
- Designing a small dashboard model before touching software

TODAY'S STRUCTURE

TWO CONNECTED PARTS

PART 2

- What is the 1C:Enterprise ?
- How the system is structured?
- How users interact with it?
- How IT world should understand it professionally?

WHY THIS MATTERS

SOFTWARE MUST SUPPORT DECISIONS

Business software does not create value simply by storing data. Its real value appears when that data becomes usable for control, comparison, evaluation, and action.

For example:

- a delivery record becomes a fulfillment KPI
- a sales record becomes revenue analysis
- an invoice becomes part of margin reporting

That is why KPI design and dashboard logic matter.

SCHOOL REPORT CARD

ANALOGY

Think about a student report card. Teachers do not record every classroom action on the final report. Instead they summarize performance using selected indicators like: exam score, attendance, homework completion and final grade

A dashboard works the same way.
It does not display every transaction. It displays the indicators that help someone judge performance and decide what to do next.

WHAT WE ARE REALLY DOING

DESIGNING CONTROL SIGNALS

A KPI is not just a number.

It is a signal that tells management whether performance is acceptable or risky.

A dashboard is not just a chart.

It is a structured view of performance designed to support decisions.

ROLE-BASED KPIS

DIFFERENT ROLES, DIFFERENT CONTROL NEEDS

Different roles require different KPIs and supporting metrics because different roles make different decisions.

A sales manager usually cares about:

lead conversion (percentage of leads that become qualified sales opportunities or customers)

pipeline value (total estimated value of all active deals in the sales pipeline)

closed deals (number of deals successfully completed and won)

ROLE-BASED KPIS

DIFFERENT ROLES, DIFFERENT CONTROL NEEDS

An operations manager usually cares about:

fulfillment time

stock shortages

delivery delays

A finance manager usually cares about:

margin

expenses

cash flow

Good KPI design always starts with the role.

HOW TO CHOOSE KPIS

START WITH DECISIONS

The correct question is **NOT**:

“What numbers do we already have?”

The correct question is:

“What decisions does this person need to make?”

That is how KPIs should be chosen.

If a number does not support a decision, it should probably not be on the dashboard.

A dashboard must reduce noise, not increase it.

SALES ROLE EXAMPLE

WHAT SALES NEEDS TO SEE

For a sales role, useful KPIs may include:

conversion rate

average deal value

pipeline velocity

number of qualified opportunities

These indicators help answer:

Is the sales funnel healthy?

Are deals moving fast enough?

Is future revenue becoming stronger or weaker?

This is why sales dashboards must focus on demand and movement, not
only final revenue

OPERATIONS ROLE EXAMPLE

WHAT OPERATIONS NEEDS TO SEE

For an operations role useful KPIs may include:

fulfillment time

late shipment percentage

stockout frequency

inventory turnover

These indicators help answer:

Are orders being completed on time?

Is stock being managed efficiently?

Are operational delays increasing costs or damaging service quality?

Operations dashboards must focus on flow, reliability, and speed.

FINANCE ROLE EXAMPLE

WHAT FINANCE NEEDS TO SEE

For a finance role useful KPIs may include:

gross profit

net income

expense trend

cash collected vs invoiced

These indicators help answer:

Is the business really profitable?

Are costs growing too quickly?

Is recorded revenue becoming real cash?

Finance dashboards must focus on truth, not optimism.

SAME SYSTEM BUT DIFFERENT VIEWS

ANALOGY

In games, different players see different information:

- a driver watches speed and fuel
- a sniper watches distance and target position
- a team leader watches map control

The system is the same, but the indicators differ by role.

SAME SYSTEM BUT DIFFERENT VIEWS

ANALOGY

Dashboards work the same way.

One business can have multiple valid views, but each view must match a clear responsibility.

KPI SELECTION RULE

FEWER BUT STRONGER

A dashboard with too many numbers usually means that nobody made a real decision about what matters.

A good dashboard does not try to impress.
It tries to support action.

For example:

4 to 6 strong indicators are often enough for one role cuz 20 mixed indicators usually create confusion.

Better to have a small dashboard with clear meaning than a crowded dashboard with no priority.

FROM KPI TO ACTION

WHY THRESHOLDS EXIST

A KPI becomes useful only when it has a threshold or limit.

Example:

conversion rate above 20% = healthy

10% to 20% = warning

below 10% = critical

Without thresholds, a dashboard only shows numbers.

With thresholds, it shows what the numbers mean.

That is how measurement becomes control.

SETTING THRESHOLDS

GOOD, WARNING, CRITICAL

Thresholds usually separate performance into levels such as:

Good

Warning

Critical

This matters because managers do not only want to know the value. They want to know whether the situation is acceptable, unstable, or dangerous.

Thresholds should be based on business reality, historical performance, or target expectations, not on random guesses.

SETTING ACTIONS

WHAT HAPPENS AFTER THE KPI

Every important KPI should be linked to a clear action.

Examples:

low conversion → review sales qualification process

high stock aging → reduce purchasing or improve demand forecasting

rising expenses → investigate cost drivers

delayed deliveries → review logistics workflow

A KPI without action is just observation

A KPI with action becomes a management tool

TEMPERATURE WARNING MODEL

ANALOGY

A thermometer is useful because it does more than show a number.

If temperature is normal → continue monitoring

If temperature rises too high → take action

KPIs work in the same way:

normal range → monitor

warning range → investigate

critical range → intervene

This is why thresholds and actions belong together.

MULTIPLE TRUTHS PROBLEM

WHEN DEPARTMENTS DISAGREE

One of the most common enterprise reporting problems is this:

The sales dashboard shows one revenue number.

The finance dashboard shows another.

Why?

Because the same business word is being measured in different ways.

This creates confusion, arguments, and loss of trust in the dashboard itself.

WHY MULTIPLE TRUTHS HAPPEN

DIFFERENT RULES, SAME WORD

Sales may define revenue as **closed deals in CRM**

Finance may define **revenue** as **invoices issued** or **cash received**

Both use the word **revenue**, but they are not calculating the same thing.

This is why metric definitions matter.

Without standard definitions, dashboards become inconsistent even when the software works correctly.

KPI DEFINITION TABLE

PREVENTING CONFUSION

A KPI definition table is a simple but powerful control tool.

For each KPI, it defines:

- **KPI name**
- **business purpose**
- **formula**
- **data source**
- **owner**
- **threshold**
- **action**

This is how organizations prevent “multiple truths” and maintain one version of reporting logic.

WHY DEFINITION TABLES MATTER

ONE VERSION OF TRUTH

A definition table makes dashboards more reliable because it answers the hidden questions:

What exactly are we measuring?

How is it calculated?

Which system provides the data?

Who is responsible for it?

What happens when it fails?

Without these answers, different teams will create different numbers and call them the same KPI.

EXAMPLE KPI TABLE ENTRY

REVENUE AS A CONTROLLED INDICATOR

KPI name	Revenue
Purpose	monitor financial performance
Formula	total invoiced amount for the reporting period
Data source	accounting / ERP
Owner	finance manager
Threshold	below target = investigate
Action	review billing, collections, or sales mix

This turns a vague business word into a controlled and traceable indicator

PAPER DASHBOARD MODEL

BUILD THE LOGIC BEFORE SOFTWARE

Before using Power BI, Excel, or any dashboard tool, it is often better to model the dashboard on paper first.

Why?

Because software can make a bad idea look impressive.

A paper model forces clarity before design.

It answers:

What is the role?

What are the most important KPIs?

What actions should be triggered?

WHY PAPER FIRST WORKS

THINKING BEFORE BUILDING

If people go into software too early they often focus on:

colors

chart types

layout

decoration

But paper modeling forces focus on:

logic

priorities

definitions

decision value

That is why experienced analysts often design the dashboard concept
before touching any tool

SMALL DASHBOARD MODEL

SALES EXAMPLE

A basic sales dashboard on paper might include:

Leads this week

Conversion rate

Pipeline value

Revenue vs target

One alert message

That is enough for a first version.

The goal is not to show everything. The goal is to help the sales manager decide what needs attention now.

SMALL DASHBOARD MODEL

OPERATIONS EXAMPLE

A basic operations dashboard on paper might include:

Late shipment %

Average fulfillment time

Stockout count

Inventory aging

One action alert

This makes the dashboard role-specific, practical, and easy to test before software.

A dashboard should always feel like a work tool, not a poster.

1C:ENTERPRISE INTRODUCTION

WHY THIS SYSTEM MATTERS

1C:ENTERPRISE INTRODUCTION

WHY THIS SYSTEM MATTERS

1C:Enterprise is widely used for business process and accounting automation, especially in CIS business environments.

It is not just an accounting screen. It is a platform used to build and run business applications.

1C is important because it connects:

accounting logic

operational records

ERP-style workflows

reporting and business control

WHAT 1C REALLY IS

PLATFORM + CONFIGURATION

A useful way to understand 1C is this:

the platform is the engine

the configuration is the business application built on that engine

This means 1C is not a single fixed application.

It is an environment where business logic can be configured for accounting, trade, payroll, inventory, and other business tasks.

PHONE OS AND APP

ANALOGY

Think about a smartphone:

Android / iOS = platform

banking app / game / messenger = application

In 1C:

1C:Enterprise platform = operating environment

accounting / trade / payroll configuration = business application

1C is more than one screen or one menu

DESIGNER VS ENTERPRISE MODE

TWO MAIN WAYS OF WORKING

1C distinguishes two main working modes:

Designer mode

1C:Enterprise mode

Designer mode = setup, configuration, administration, development

1C:Enterprise mode = everyday business work by users inside the
application

WHO USES WHICH MODE

USERS VS IT/ADMIN

Typical everyday users work in **1C Enterprise mode**:

accountants

managers

clerks or operators

Typical IT / admin / developer work happens in **Designer mode**:

adjusting configurations

modifying forms

maintaining system structures

administrative tasks

CLIENT OPTIONS

HOW 1C CAN BE USED

1C supports multiple client approaches, including:

browser-based web access

installed client applications

file mode

client/server mode

This matters because companies can choose simpler or more scalable deployment depending on their size, budget, and workload.

FILE MODE VS CLIENT/SERVER

SMALL VS LARGER DEPLOYMENT

File mode: smaller, simpler and often suitable for a single user or small setup

Client/server mode:

more scalable

better for heavier workloads

more suitable for larger organizations

WHAT USERS SEE IN 1C

INTERFACE LOGIC

A beginner should expect the 1C user environment to revolve around:

catalogs / lists

documents

forms

reports

commands / actions

This is not a random interface.

It reflects how business data is entered, stored, processed, and reviewed inside the system.

CATALOGS AND DOCUMENTS

MASTER DATA VS BUSINESS EVENTS

Catalogs store reference information:

customers

products

suppliers

Documents record business events:

sales

purchases

payments

shipments

This distinction is essential because most enterprise systems separate
things that exist from **things that happened**

FORMS AND FIELDS

HOW USERS INTERACT WITH DATA

In 1C forms are where users enter, review, and update business data. Fields must be completed correctly, because incorrect input leads to incorrect reports and incorrect decisions.

Analogy:

A form is like an online application.

If the data entered is wrong, the final result is wrong even if the software itself works perfectly.

REPORTS IN 1C

FROM RECORDS TO BUSINESS MEANING

1C supports reporting features such as:

report generation

calculated fields

spreadsheet-style output

charts and summaries

Data entry is not the final goal.

Reports are where business meaning becomes visible.

ROLES AND ACCESS

WHO IS ALLOWED TO DO WHAT

1C training materials emphasize users and roles because enterprise systems must control permissions carefully.

Not every user should be able to:

create

edit

approve

delete

post documents

This is not only a technical issue.

It is also a control, accountability, and risk-management issue.

BASIC WORKING RULES IN 1C

HOW TO WORK SAFELY

Safest working rules are:

- enter data carefully
- use the correct document type
- do not guess unknown fields
- understand before posting or saving
- respect user roles and access rights
- verify reports after entry

These habits matter in every enterprise system, not only in 1C.

FINAL TAKEAWAY

FROM KPIS TO REAL SYSTEM WORK

A business needs well-designed KPIs and dashboards to avoid weak or misleading decisions

A system like 1C:Enterprise matters because it is one of the places where business records are actually created, controlled, and later turned into reports and management indicators

NEXT WEEK PREVIEW

WHAT'S COMING

1C Enterprise workflow

Accounting entries in system form
